

Deploying the Dive cam™

During the 1996 Olympics you will be following the diver from the start of his or her dive to the finish via a newly installed diving camera invented by Garrett Brown. A very basic principle is employed via some pulleys. An operator holds a wire that goes through a pulley and into a tube and is attached to a video camera. As the diver drops the operator releases the wire and the camera drops. It is stopped by a bunji cord.
